SYSTÈME DE VEILLE

Menu Maker by
Qwenta

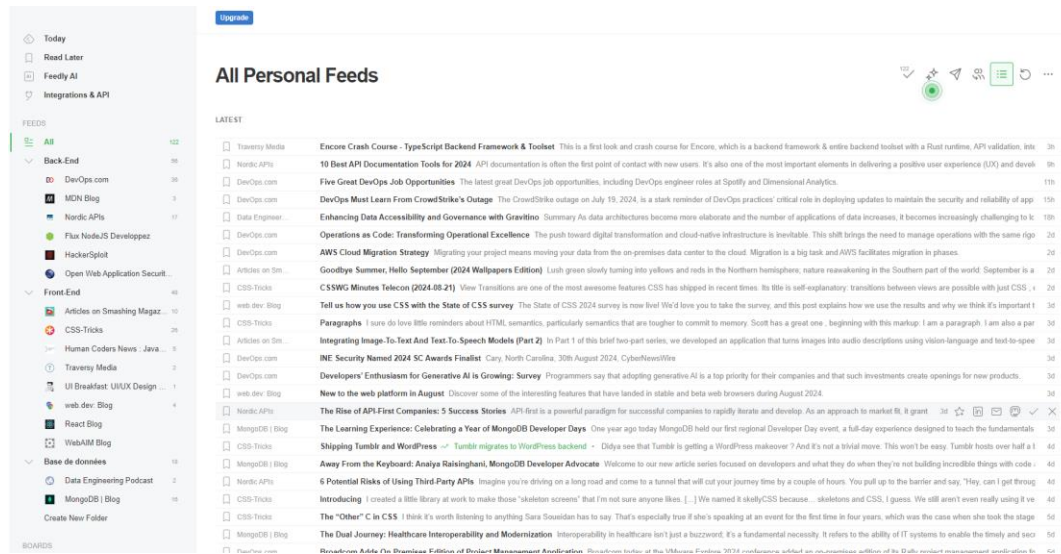

Feedly est une application et un service web d'agrégation de nouvelles qui permet aux utilisateurs d'organiser, lire et partager du contenu provenant de leurs sites web et blogs préférés en un seul endroit.

Feedly utilise des flux RSS (Really Simple Syndication) pour recueillir et afficher les dernières mises à jour des sites suivis par les utilisateurs, dans un format épuré et facile à lire.

La plateforme est utilisée tant par des particuliers que par des professionnels souhaitant rester informés sur des sujets spécifiques, car elle permet de personnaliser et de catégoriser les sources d'information selon les intérêts de chacun.

J'ai créé trois dossiers pour séparer les articles sur le Front-End, le Back-End et la Base de Données.

1. Back-End

1. Safe zone: persistence likely works
2. Danger zone: oversight, appropriate mitigation
3. Off limits: exchange

Product Tracking

The diagram illustrates a product tracking system architecture. It features a central 'Google Cloud' box containing a cloud icon and the text 'Data Ingestion Database'. To the left, a box labeled 'API Streaming' has an arrow pointing to the Google Cloud box. Above the Google Cloud box, a box labeled 'Amazon RDS: Batch update' has an arrow pointing to it. Below the Google Cloud box, a box labeled 'API REST' has an arrow pointing to it. To the right of the Google Cloud box, a box labeled 'Public interface to other RDS instances' has an arrow pointing to it. On the far right, a box labeled 'Amazon EMR: Elastic MapReduce' contains a box labeled 'Amazon EMR: Elastic MapReduce' and a box labeled 'Hadoop'.
